                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 9, Application US/09155076A

Patent No. US20020054870A1

GENERAL INFORMATION:

APPLICANT: GTENDAL

TITLE OF INVENTION: ACTIVE AS A CALCIUM CHANNEL MODULATOR

TITLE OF INVENTION: ACTIVE AS A CALCIUM CHANNEL MODULATOR

TITLE OF INVENTION: ACTIVE AS A CALCIUM CHANNEL MODULATOR

TITLE OF INVENTION: ACTIVE AS A CALCIUM CHANNEL MODULATOR

CURRENT APPLICATION NUMBER: US/09/155,076A

CURRENT PILING DATE: 1998-10-23

NUMBER OF SEQ ID NOS: 15

SOFTWARE: PATENTIN Ver. 2.0

SEQ ID NO 9

LENGTH: 44
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
Patent No. US20020054870A1
GENERAL INFORMATION:
APPLICANT: GETEERIED:
APPLICANT: GETEERIED:
TITLE OF INVENTION: PEPTIDE FROM SOLUBLE FORM OF ACETYLCHOLINESTERASE,
TITLE OF INVENTION: ACTIVE AS A CALCIUM CHANNEL MODULATOR
FILE REPERENCE: 98-0967*/WMC/00263
CURRENT APPLICATION NUMBER: US/09/155,076A
UUMBER OF SEQ ID NOS: 15
SOFTWARE: Batentin Ver. 2.0
SEQ ID NO 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FRATURE:

Sequence 19, Application US/09748739A

Patent No. US20020119489A1

GENERAL INPORMATION:
APPLICANT: LOCKTIGGE, Oksana

APPLICANT: Watkins, Jeffry D.
TITLE OF INVENTION: Butyrylcholinesterase Variants and
TITLE OF INVENTION: Methods of Use
FILE REFERENCE: P-IX 4143

CURRENT APPLICATION NUMBER: US/09/748,739A

CURRENT APPLICATION NUMBER: 2000-12-06

NUMBER OF SEQ ID NOS: 31

SOFTWARE: FastSEQ for Windows Version 4.0

SEQ ID NO 19

TYPE: PRT
                                                                                 Sequence 18, Application US/09748739A
Patent No. US2022019489A1
GENERAL INFORMATION:
APPLICANT: LOCKTIGGE, Oksana
APPLICANT: Watkins, Jeffry D.
TITLE OF INVENTION: Butryrlcholinesterase Variants and
TITLE OF INVENTION: Mathods of Use
FILE REFERENCE: P-IX 4143
CURRENT FILING DATE: 2000-12-06
NUMBER OF SEQ ID NOS: 31

Sequence 22, Application US/08446100

Patent No. 6001625
GENERAL INFORMATION:
APPLICANT: Broomfield, Clarence A
APPLICANT: Millard, Charles B
APPLICANT: Lockridge, Oksana
TITLE OF INVENTION: Site-Directed Mutagenesis of Esterases
NUMBER OF SEQUENCES: 31
CORRESPONDENCE ADDRESS:
ADDRESSEE: Hendricks and Assoc.
STREET: 9669 A Main Street, P.O. Box 2509
CITY: Fairfax

Sequence 4, Application US/08446100

Patent No. 601625

GENERAL INFORMATION:

APPLICANT: Broomfield, Clarence A

APPLICANT: Millard, Charles B

APPLICANT: Lockridge, Okeana

TITLE OF INVENTION: Site-Directed Mutagenesis of Esterases

NUMBER OF SEQUENCES: 31

CORRESPONDENCE ADDRESS:

ADDRESSE: Hendricks and Assoc.

STREET: 9669 A Main Street, P.O. Box 2509
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Sequence 9, Application US/08446100

Sequence 9, Application US/08446100

Patent No. 6001625

GENERAL INFORMATION:

APPLICANT: Broomfield, Clarence A

APPLICANT: Iockridge, Okeana

TITLE OF INVENTION: Site-Directed Mutagenesis of Esterases

NUMBER OF SEQUENCES:

ADDRESSEE: Hendricks and Assoc.

STREET: 9669 A Main Street, P.O. Box 2509

CITY: Fairfax

STATE: VA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 602;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2, Indels

Patent No. 6001625

GENERAL INFORMATION:
APPLICANT: Broomfield, Clarence A
APPLICANT: Millard, Charles B
APPLICANT: Lockridge, Oksana
TILLE OF INVENTION: Site-Directed Mutagenesis of Esterases
NUMBER OF SEQUENCES: 31
CORRESPONDENCE ADDRESS:
ADDRESSEE: Hendricks and Assoc.
STREET: 9669 A Main Street, P.O. Box 2509
CITY: Fairfax
APPLICANT: Lockridge, Oksana
TITLE OF INVENTION: Site-Directed Mutagenesis of Esterases
NUMBER OF SEQUENCES: 31
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DB 3; Length 602;

Sequence 4, Application US/09334489
Patent No. 6291175
GENERAL INPORMATION:
APPLICANT: Pietre Sevigny
APPLICANT: Heiko Wiebbusch
TITLE OF INVENTION: METHODS FOR TREATING A NEUROLOGICAL
TITLE OF INVENTION: DISEASE BY DETERMINING BCHE GENOTYPE
FILE REFERENT & DELCATION NUMBER: US/09/334,489
CURRENT APPLICATION NUMBER: US/09/334,489
CURRENT FILING DATE: 1999-06-16
NUMBER OF SEQ ID NOS: 8
NUMBER OF SEQ ID NOS: 8
SEQ ID NOS - 8
LENGTH: 602
Sequence 3, Application US/09334489
Patent No. 629175
GENERAL INFORMATION:
APPLICANT: Faith Schappert
APPLICANT: Kaith Schappert
APPLICANT: Heiko Wiesbusch
TITLE OF INVENTION: DISEASE BY DETERMINING BCHE GENOTYPE
FILE REFREENCE: 08523/01302.
CURRENT APLICATION NUMBER: US/09/334,489
CURRENT PILING DATE: 1999-06-16
PRIOR FILING DATE: 1998-06-18
NUMBER OF SEQ ID NOS: 8
SOFTWARE: FaetsEQ for Windows Version 4.0
SEQ ID NO 3
LENGTH: 602
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match 71.3%; Score 62; DB 3; Length 602; Best Local Similarity 64.3%; Pred. No. 0.59; Matches 9; Conservative 3; Mismatches 2; Indels

MISCELLANEOUS: Synapses usually contain asymmetric molecules of cholinesterase, with a collagen-like part disulfide-bonded to the catalytic part. A different, globular type of cholinesterase occurs on the outer surfaces of cell membranes, including those of

Interchain (By similarity).
N-linked (GlCNAC...) (Potential).
N-linked (GlCNAC...) (Potential).
-i- MISCELLANEOUS: This is the catalytic subunit of an asymmetric or soluble form of ACHE.
-i- SIMILARITY: Belongs to the type-B carboxylesterase/lipase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SEQUENCE FROM N.A., AND ALTERNATIVE SPLICING.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    both in cat plasma.";
Blochem. Pharmacol. 60:479-487(2000).
--- FUNCTION: Rapidly hydrolyzes choline released into the synapse.
--- CATALYTIC ACTIVITY: Acetylcholine + H(2)O = choline + acetate.
--- SUBDUNI: Interacts with PRIMA1. The interaction with PRIMA1 is required to anchor it to the basal lamina of cells and organize
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Felis silvestris catus (Cat).

into tetramers (By similarity). Isoform H generates GPI-anchored diamers, disulfide linked. Isoform T generates multiple structures, ranging from monomers and dimers to collagen-tailed and hydrophobic-tailed forms, in which catalytic tetramers are associated with anchoring proteins that attach them to the basal Tamina or to cell membranes. In the collagen-tailed forms, isoform T subunits are associated with a specific collagen, COLO, which triggers the formation of isoform T tetramers, from monomers and

-I- FUNCTION: Rapidly hydrolyzes choline released into the synapse.
-I- CATALYTIC ACTIVITY: Acetylcholine + H(12)0 = choline + acetate.
-I- CATALYTIC ACTIVITY: Acetylcholine + H(12)0 = choline + acetate.
-I- SUBUNIT: Interacts with PRIMAL. The interaction with PRIMAL is required to anchor it to the basal lamina of cells and organize into tetramers (By similarity). Isoform H generates GPI-anchored dimers; (Bullide linked. Isoform T generates multiple structures, ranging from monomers and dimers to collagon-tailed and hydrophobic-tailed forms, in which catalytic tetramers are associated with anchoring proteins that attach them to the basal lamina or to cell membranes. In the collagon-tailed forms, isoform T subunits are associated with a specific collagen, COLO, which triggers the formation of isoform T tetramers, from monomers and

Bartels C.F., Zelinaki T., Lockridge O.;

"Mutation at codon 322 in the human acetylcholinesterase (ACHE) gene accounts for YT blood group polymorphism.";

Am. J. Hum. Genet. 52:928-936(1993).

-!- FUNCTION: Rapidly hydrolyzes choline released into the synapse.

-!- CATALYTIC ACTIVITY: Acetylcholine + H(2)O = choline + acetate.

-!- SUBUNIT: Homotetramer; composed of disulfide-linked homodimers.

Interacts with PRIMA1. The interaction with PRIMA1 is required to anchor it to the basal lamina of cells and organize into tetramers
                                                                                                                                                                                                                                                                                                                                                                                                              MEDLINE=92388112; PubMed=1517212; Shafferman A., Kronman C., Flashner Y., Leitner M., Grosfeld H., Ordentlich A., Gozes Y., Cohen S., Ariel N., Barak D., Maria A., Gozes Y., Cohen S., Ariel N., Barak D., Mutagenesis of human acetylcholinesterase. Identification of residues involved in catalytic activity and in polypeptide folding."; J. Biol. Chem. 267:17640-17648(1992).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Isolda-P22303-2; Sequence-VSP 001457; Polymorphism: AchE is responsible for the Yt blood group system. The molecular basis of the Yt(a) = Yt1/Yt(b) = Yt2 blood group antigens is a single variation in position 353; His-353 corresponds to Yt(a) and the rare variant with Asn-353 to Yt(b). SIMILARITY: Belongs to the type-B carboxylesterase/lipase family. DATABASE: NAME-Blood group antigen mutation database; NOTE-Yt blood group system;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       acetylcholinesterase complexed with the snake-venom toxin fasciculin-

MISCELLANBOUS: This is the catalytic subunit of an asymmetric or soluble form of ACHE.
SIMILARITY: Belongs to the type-B carboxylesterase/lipase family.
                                                                                                                                                    INTERACTION WITH PRIMAL.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PEBS Lett. 315:163-166(1993).
-!- FUNCTION: Rapidly hydrolyzes choline released into the synapse.
-!- CATALYTIC ACTIVITY: Acctylcholine + H(2)0 = choline + acctate.
-!- SUBUNIT: Hometeramer; composed of disulfide-linked homodimers.
Catalytic forms H (GPI-anchor dimer) and T (asymmetric collagentailed), which differ in their C-terminus, account for all types of known ACHE forms. Interacts with PRIMA1. The interaction with PRIMA1 is required to anchor it to the basal lamina of cells and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          IsoId=P37136-3; Sequence=VSP_001459; Note=May be not functional; TISSUE SPECIFICITY: Has been found in central nervous system and muscle. Found in embryonic liver and spleen but not in adult

Biol. Chem. 272:33045-33055(1997).
--- FUNCTION: Rapidly hydrolyzes choline released into the synapse.
--- CATALYTIC ACTIVITY: Acceptionine + H(2)0 = choline + acetate.
--- SIMILARITY: Belongs to the type-B carboxylesterase/lipase family.
                                                                                                                                                                           Gaps

CATALYTIC ACTIVITY: Acetylcholine + H(2)O = choline + acetate. SUBUNIT: Dimers and collagen-tailed forms, in which catalytic tetramers are associated with anchoring proteins that attach them to the basal lamina or to cell membranes. In the collagen-tailed forms, subunits are associated with a specific collagen. COLQ, which triggers the formation of isoform T tetramers from dimers. MISCELLANEOUS: No other isoforms exist. This protein corresponds to the T isoform in other species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

--- TISSUE SPECIFICITY: Liver and muscle contain both isoform T and isoform S. Venom gland predominantly contains isoform S.
--- PTM: The N-terminus is blocked.
--- PTM: The Belongs to the type-B carboxylesterase/lipase family.
--- CAUTION: It is uncertain whether Met-1 or Met-9 is the initiator.

-!- CATALYTIC ACTIVITY: An acylcholine + H(2)O = choline + a
carboxylic acid anion.
-!- SUBUNIT: Homotetramer. The tetramer is composed of two dimers. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Prody C.A., Zevin-Sonkin D., Gnatt A., Goldberg O., Soreq H.; "Isolation and characterization of full-length cDNA clones coding for
                                                                                                                                   two subunits in a dimer are linked by a disulfide bond.
--- TISSUE SPECIFICITY: Present in most cells except erythrocytes.
--- MISCELLAMBOUS: Cholinesterase is highly reactive with organophosphate esters.
---- SIMILARITY: Belongs to the type-B carboxylesterase/lipase family.
HSSP; P21836; 1N5M.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "Structure of the gene for human butyrylcholinesterase. carboxylic acid anion.
-!- SUBUNIT: Homotetramer. The tetramer is composed of two dimers. The two subunits in a dimer are linked by a disulfide bond.
-!- TISSUB SPECIFICITY: Present in most cells except erythrocytes.
-!- DISEASE: Mutant alleles of CHEI are responsible for hypocholinesterasemia resulting in suxamethonium sensitivity. Hypocholinesterasemia resulting in suxamethonium sensitivity. Homosygous persons sustain prolonged apnea after administration of the muscle relaxant suxamethonium in connection with surgical
